SESHADRI RAO KNOWLEDGE VILLAGE, GUDLAVALLERU – 521356

CERTIFICATE

This is to certify that the community service project report entitled **"Optimizing Prawn Feed Schedules Based On Real-Time Water pH Data"** is a bonafide record of work carried out by **Sammeta Bhavya(23481A6097),**under my guidance and supervision in partial fulfillment of the requirements, for the award of the degree of Bachelor of Technology in **Internet of Things** of **Seshadri Rao Gudlavalleru Engineering College** affiliated to **Jawaharlal Nehru Technological University, Kakinada**.

Dr.B.Nagasirisha

Supervisor

Dr . Y. Syamala

Professor &Head of the Department

DECLARATION

I, **Sammeta Bhavya** a student of community service Program, Reg. No. **23481A6097** of the Department of Electronics and communication Engineering, **Seshadri Rao Gudlavalleru Engineering** College do hereby declare that I have completed the mandatory community service from 19-05-2025 to 26-07-2025 in Gudlavalleru ,under the Faculty Guide of Dr.B.NAGASIRISHA Assistant professor, Department of Internet Of Things in **Seshadrirao Gudlavalleru Engineering** College, Gudlavalleru.

(Signature and Date)

Endorsements

Faculty Guide:

Head of the Department:

Master of Trainer:

Principal:

Certificate from Official of the Community

This is to certify that Sammeta Bhavya Reg. No 23481A6097 of **Seshadri Rao Gudlavalleru Engineering College**, Gudlavalleru, A underwent community service in Gudlavalleru from 19-05-2025 to 30-05-2025,14-07-2025 To: 26-07-2025.The overall performance of the Community Service Volunteer during her community service is found to be **satisfactory**.

Authorized Signature

s

ACKNOWLEDGEMENTS

I express my deep sense of gratitude to my institutions **Seshadrirao Gudlavalleru Engineering College**, Gudlavalleru**.** While has providing us an opportunity to carry out this community service project (CSP). It is my privilege to express my sincere gratitude to **Dr.B.Nagasirisha**, Department of Internet Of Things , **Seshadrirao Gudlavalleru Engineering College** for valuable guidance, and untiring help. which enable me to complete work successfully.

I would like to express our sincere gratitude to **Dr.Y.Syamala**, Head of the department, for the valuable help provided in successful completion of the work.

we also express our gratitude to our principal **Dr. B. Karuna Kumar,** for his encouragement and facilities provided during the course of project.

I am thankful to the community and officials from the community for giving the necessary information and very thankful to all faculty members for their motivation and knowledge rendered though out our programme and to our non-teaching staff of our department.

I wish to thankful for all our friends, who have helped us in various stages and for giving valuable suggestions throughout the project. I wish to thank all the community people who helped in to do project in successful way. I also be grateful to grama sarpanch who give the permission to do our project in well manner.

S. Bhavya(23481A6097).

CHAPTER 1

1.1EXECUTIVE SUMMARY

This Community Service Project focuses on optimizing prawn feed schedules based on real-time water pH monitoring using Internet of Things (IoT) technology. Prawn farming is a vital source of livelihood for many coastal communities, but traditional feeding practices often rely on estimation rather than scientific data. This leads to uncontrolled feeding, poor water quality, reduced prawn growth, and economic losses for farmers.

The proposed system integrates pH sensors, an ESP32/NodeMCU microcontroller, and cloud-based data logging to continuously monitor pond conditions. Based on the pH value, the system automatically provides feeding recommendations and alerts to the farmer through a mobile application or SMS. The data collected is stored and analyzed to determine trends, optimize feeding schedules, and predict unfavorable conditions in advance.

By adopting this smart IoT-based solution, prawn farmers can achieve better feed utilization, improved water quality, higher yield, and reduced operational costs. The project not only introduces a technological innovation but also promotes sustainable aquaculture practices and supports the economic well-being of rural communities.

This initiative demonstrates how digital transformation in aquaculture can empower small-scale farmers, minimize resource wastage, and contribute to environmental conservation while ensuring profitable and responsible prawn farming.

1.2Learning Objectives:

The Community Service Project helped the students understand the real-time challenges faced by aquaculture farmers and apply technological solutions through IoT. The key learning objectives of this project are:

1. To understand the role of water quality (especially pH) in prawn farming and how it affects growth, feed utilization, and survival rate.
2. To learn the application of IoT in aquaculture, including sensor integration, data transmission, and real-time monitoring.
3. To develop problem-solving and analytical skills by collecting field data and designing a smart system that responds to real conditions.
4. To create awareness about sustainable aquaculture practices that reduce pollution and improve economic outcomes for farmers.
5. To improve teamwork, communication, and social responsibility by interacting with local farmers and understanding community-based issues.

1.3Learning Outcomes:

Gained practical knowledge of IoT applications in aquaculture:

1. Learned integration of sensors and microcontrollers for real-time monitoring.
2. Developed ability to identify problems and design technical solutions.
3. Understood the importance of sustainable and eco-friendly prawn farming.
4. Improved teamwork, communication, and leadership skills.
5. Enhanced social responsibility through community engagement.
6. Learned data collection, analysis, and decision-making using IoT platforms.

Fig1.1 Data Collected From Farmer

CHAPTER 2

2.1 OVERVIEW OF THE COMMUNITY

The community is: Gudlavalleru

Gudlavalleru is a rural village located in the Krishna District of Andhra Pradesh, known for its agricultural and aquaculture activities. The majority of the local population depends on **prawn and fish farming** as their main source of livelihood. The community consists of hardworking farmers who rely on traditional methods for feeding and maintaining pond water quality.

Although the villagers have good practical experience, there is limited awareness about **modern technological solutions like IoT-based monitoring**. The CSP team interacted with several farmers in this community to understand their challenges related to **water pH imbalance, feed wastage, and disease outbreaks in prawns**. The visit provided valuable insights into how digital tools can improve their farming efficiency and overall income.

Location: -

Gudlavalleru(v), latitude -16.3482° N ,longitude -81.0465° E

2.2Socio-economic conditions of the communities: -

The community in **Gudlavalleru** primarily depends on **agriculture and aquaculture**, especially **prawn and fish farming**, as their main sources of livelihood. Most farmers belong to **small and medium-scale families**, cultivating small ponds and agricultural lands. Their income mainly depends on seasonal yields and market prices, which often fluctuate due to weather changes and water quality issues.

While the literacy rate in the area is improving, there is still **limited exposure to modern technologies** in farming. Many farmers rely on **traditional feeding and monitoring methods**, which lead to increased expenses and reduced productivity. Access to credit, government schemes, and digital tools is available but underutilized due to lack of technical awareness.

Despite these challenges, the people of Gudlavalleru show a strong **interest in learning new, sustainable, and technology-driven practices** that can improve their income and reduce risk in aquaculture. This makes the community an ideal place to implement and demonstrate IoT-based solutions for smart prawn farming.

Fig2.1 Interaction With Aqua Farmer

CHAPTER 3

3.1COMMUNITY SERVICE PART

- **<u>The activities done during the community service project are as follows: -</u>**
- Firstly, I have taken the acceptance letter from our department and discussed about various topic with allotted guide. She helped me in the taking of the topic and thought the various things regarding the topic. Then I moved to the community and taken permission letter from the grama sarpanch. The data has been collected from then grama sarpanch of village population. So, I started my project initially by observing how people doing prawn feed. Then I look up into how the prawn feed is given manually and identified them in the detailed way. Then I went to the ways they start how to feed the prawns and where they used to buy them. So, that we know how the quality and quantity of the feed is.
- It involves a series of interconnected activities that blend sensor technology, data analytics, and automation. The process begins with the deployment of water quality sensors in the prawn ponds. These sensors continuously monitor parameters such as pH, temperature, and dissolved oxygen, which are critical for prawn health and feeding behavior. Ensuring accurate calibration of these sensors is essential to maintain data reliability.
- As part of the CSP implementation, a meeting was conducted with a local prawn farmer to introduce the project focused on optimizing prawn feed schedules using real-time water pH data. The discussion began with a brief explanation of the project's objective—to improve feed efficiency and prawn health by leveraging sensor-based monitoring and automated decision-making. The farmer was informed about the impact of water pH on prawn metabolism and feeding behavior, and how manual monitoring can be time-consuming and inconsistent. The proposed solution involves deploying water quality sensors in the pond to continuously monitor pH levels, transmitting the data to a central system, and using algorithms to adjust feeding schedules accordingly. The benefits highlighted included reduced feed waste, improved growth rates, and timely alerts for water quality deviations. The farmer was assured of full support during setup and training, and was invited to participate in the pilot phase to observe the system's effectiveness firsthand. The interaction aimed to build trust, clarify technical aspects, and encouragethem.

CHAPTER 4

4.1 OUTCOMES DESCRIPTION

Details of the Socio-Economic Survey of the Village/Habitation. Attach the questionnaire prepared for the survey.

Describe the problems you have identified in the community

Short-term and long-term action plan for possible solutions for the problems identified and that could be recommended to the concerned authorities for implementation.

Short-Term action plans
Long-Term goals

Description of the Community awareness programme/s conducted w.r.t the problems and their outcomes.

Description
Outcomes

Report of the mini-project work done in the related subject w.r.t the habitation/village.

Project Title: "Optimizing Prawn Feed Schedule Based on Real-Time Water pH Data"

The mini-project titled "**Optimizing Prawn Feed Schedule Based on Real-Time Water pH Data**" was carried out in Gudlavalleru village, Krishna District, Andhra Pradesh, where aquaculture, especially prawn farming, is one of the major occupations. During the field visits, it was observed that most farmers depend on traditional feeding methods and manual pH monitoring, which often lead to feed wastage, water pollution, and reduced prawn growth.

To address this issue, the team designed an IoT-based smart monitoring system using pH sensors, an ESP32/NodeMCU microcontroller, and a cloud platform. The system continuously monitors pond water pH and provides real-time alerts and feeding recommendations to farmers. This enables farmers to feed prawns only under suitable water conditions, thereby reducing wastage and maintaining pond health.

Through this project, the team interacted with the local community, created awareness about scientific and sustainable aquaculture, and demonstrated how digital technology can improve farm productivity and profitability. The work contributed to both technical learning for students and social impact for the villagers by promoting eco-friendly aquaculture practices and economic improvement.

INTRODUCTION:

Aquaculture, particularly **prawn farming**, plays a vital role in supporting the rural economy and food production in coastal regions like **Gudlavalleru village** of Krishna District, Andhra Pradesh. Prawns are a high-value export commodity, and their farming provides livelihood to thousands of families. However, the success of prawn farming largely depends on maintaining **good water quality** and **effective feeding management**.

One of the most critical water parameters is **pH**, which directly influences the prawn's metabolism, appetite, and overall growth. When the pH level of the pond water goes beyond the ideal range (7.0–8.5), prawns experience stress, reduced feeding, and higher mortality. Most farmers still rely on **manual pH testing and fixed feeding schedules**, which often leads to **feed wastage, water pollution, and economic loss**.

To overcome these challenges, an **IoT-based smart monitoring system** has been proposed in this project. The system continuously monitors the **real-time pH level of the water** and provides **automatic alerts and feeding recommendations** to the farmer. This ensures that feeding occurs only when water quality is suitable, optimizing feed usage, improving growth rate, and maintaining sustainable aquaculture practices.

This project not only helps improve farm productivity but also creates awareness among the local community about the use of **modern technology in traditional aquaculture**. It bridges the gap between **technical education and community needs**, demonstrating how engineering knowledge can be applied to solve real-life problems in rural areas.

AQUA LAWS:

Aquaculture in India is regulated under various **national and state-level laws and guidelines** to ensure **environmental protection, sustainable farming practices, and food safety**. These laws help prevent pollution, protect coastal ecosystems, and maintain the quality of aquaculture produce.

1. Coastal Aquaculture Authority Act, 2005

- Enacted by the Government of India to regulate shrimp and prawn farming in coastal areas.
- Establishes the **Coastal Aquaculture Authority (CAA)** to grant approval for aquaculture farms.
- Ensures that aquaculture activities are carried out **without causing harm to coastal ecology**.

2. Environmental Protection Act, 1986

- Provides legal authority to control and prevent water pollution caused by aquaculture.
- Mandates proper waste disposal and prohibits release of untreated water from prawn ponds into natural water bodies.

3. Water (Prevention and Control of Pollution) Act, 1974

- Aims to maintain and restore the **quality of water**.
- Requires aquaculture farms to manage effluents and avoid contamination of nearby rivers or canals.

4. Food Safety and Standards Act (FSSA), 2006

- Regulates **quality and safety** of aquaculture produce meant for human consumption and export.
- Ensures prawns and fish are farmed using **safe feed and hygienic practices**.

5. State Fisheries Department Regulations

- Each state, including **Andhra Pradesh**, has its own guidelines under the Department of Fisheries.
- These cover **farm registration, seed quality control, disease management**, and responsible use of chemicals.

Prawn Feeding

Prawn feeding is one of the most important aspects of aquaculture management because it directly affects the growth rate, survival, water quality, and profitability of the farm. Feed generally accounts for 60–70% of the total farming cost, so efficient feed management is essential for successful prawn cultivation.

Types of Feed for Different Prawns:

1. Natural Feed

Natural feed forms the **primary food source** in traditional and semi-intensive ponds. It includes:

- **Phytoplankton and Zooplankton** – naturally available in ponds and act as live feed for larvae and juveniles.
- **Detritus and Organic Matter** – decayed plant and animal material.
- **Microorganisms** – bacteria, algae, and protozoa that provide essential nutrients.

Used mainly for: Early-stage prawns and larvae in nursery ponds.

2. Artificial or Formulated Feed

These are **manufactured feeds** prepared using fish meal, soybean meal, rice bran, and other protein-rich ingredients. Artificial feed ensures a **balanced diet** and consistent nutrient supply throughout the culture period.

3. Types of Feed Based on Prawn Species:

Prawn Species	Feed Type	Protein Content (%)	pH Range
Macrobrachium rosenbergii *(Freshwater Giant Prawn)*	Crumbled or pellet feed, fish meal, soybean meal	30–35%	7.0-8.5
Penaeus monodon *(Black Tiger Prawn)*	Pellet feed with marine fish and shrimp meal	38–42%	7.5-8.5
Litopenaeus vannamei *(Whiteleg / Pacific White Shrimp)*	Commercial floating/sinking pellet	32–38%	7.0-8.0
Metapenaeus dobsoni *(Kadal shrimp)*	Natural feed + groundnut cake, rice bran	25–30%	7.2-8.3

4. Feed Types Based on Growth Stage

Stage	Feed Type	Frequency	Feed Size
Larva	Algae, egg yolk, Artemia, micro-pellets	5–6 times/day	Very fine powder or suspension
Juvenile	Crumble feed, plankton	3–4 times/day	Small pellets (0.5–1 mm)
Adult	Sinking pellets, formulated feed	2–3 times/day	Larger pellets (1.5–2.5 mm)

5.Key Nutritional Components in Prawn Feed

- **Proteins:** For growth and muscle development.
- **Lipids:** Provide energy and essential fatty acids.
- **Carbohydrates:** Support metabolism and molting.
- **Vitamins and Minerals:** Strengthen immunity and shell formation.
- **Binders and Additives:** Improve water stability of feed.

6.Sustainable and Eco-Friendly Feed Practices

- Use **biofloc-based feed** or **fermented plant proteins** to reduce chemical usage.
- Adopt **IoT-controlled feeding** to reduce overfeeding and pollution.
- Utilize **locally available ingredients** like groundnut cake, rice bran, and fish waste for cost-effective feeding.

Different prawn species require different **feed types and protein levels**, but **balanced nutrition and smart feeding schedules** are key to achieving **maximum growth and sustainability**.

CHAPTER 5
5.1RECOMMENDATIONS AND CONCLUSIONS OF THE MINI PROJECT

Conclusions

The project **"Optimizing Prawn Feed Schedule Based on Real-Time Water pH Data"** successfully demonstrates how **IoT technology can be applied in aquaculture** to enhance efficiency and sustainability. By linking feeding management with real-time pH data, farmers can make informed decisions that **reduce feed wastage, improve water quality, and increase prawn yield**.

The proposed system provides **automated alerts, data logging, and performance analysis**, helping farmers transition from traditional to modern, data-driven aquaculture. This initiative bridges the gap between **engineering knowledge and community application**, showing how innovation can directly benefit rural livelihoods.

In conclusion, adopting IoT-based solutions in aquaculture will lead to **higher productivity, lower environmental impact, and greater economic stability** for prawn farmers in villages like **Gudlavalleru**.

Recommendations

1. **Adoption of IoT-Based Systems:**
   Farmers should implement IoT-enabled pH monitoring systems to continuously track water quality and adjust feeding schedules automatically.
2. **Regular Water Quality Monitoring:**
   Maintain the pond's pH between **7.0 and 8.5**, and measure temperature and dissolved oxygen daily to prevent stress and mortality.
3. **Smart Feeding Practices:**
   - Feed only during favorable pH conditions.
   - Avoid overfeeding; monitor feed trays or sensor data to assess consumption.
   - Use automated or sensor-based feeders to minimize wastage.
4. **Farmer Awareness Programs:**
   Conduct training sessions to educate farmers about scientific feeding, water testing, and sustainable aquaculture practices.
5. **Data Logging and Record Keeping:**
   Maintain digital records of water quality parameters and feeding times to identify trends and improve future productivity.
6. **Sustainable Aquaculture:**
   Promote eco-friendly feed ingredients and safe waste disposal methods to reduce environmental pollution.
7. **Government and Institutional Support:**
   Encourage subsidies and training programs for small-scale farmers to adopt smart aquaculture technologies

Student Self-Evaluation for the Community Service Project

Student Name: S. Bhavya

Registration No: 23481A6097

Period of CSP: From:19-05-2025 To: 26-07-2025

Date of Evaluation:22-10-2025

Name of the Person in-charge: Dr.B.Nagasirisha

Address with mobile number: Nadupuru. mobile:8328565377
